

CS 303 – Algorithms

Project 1

Due February 5, 2016

Ben Dykstra

I tested my code using a generated array of psuedo-random numbers. I called mergesort on the array. After mergesort was done, I iterated over the array and tested whether the next element of the array was greater than the current one. If this condition held true for the entire array the test passed, else the test failed.
